

Discharge Summary

Patient Name:

Vaishnavi

Diagnosis:

Fever and Diarrhea

Treatment:

1. Hydration: Drink plenty of fluids such as water and oral rehydration solution (ORS) to prevent dehydration. Avoid caffeinated, alcoholic, and sugary drinks. 2. Diet: Eat small, bland meals (e.g., bananas, rice, applesauce, toast). Avoid spicy, fatty, and heavy foods. 3. Medications: Use acetaminophen or ibuprofen for fever, if not contraindicated. For mild diarrhea, most cases resolve on their own; use ORS as needed. Loperamide may be used in adults for sudden, non-bloody diarrhea (do not use if blood/mucus is present or fever is high). Avoid antibiotics unless prescribed. 4. Rest: Ensure adequate rest for recovery. 5. Seek medical attention if you have high fever ($>102^{\circ}\text{F}$ or 39°C), bloody diarrhea, severe dehydration (dizziness, dry mouth, minimal urination), or symptoms lasting more than 3 days.
